CASE STUDY

How Chat Advance Funded a Declined Deal in 5 Minutes

A small business owner was auto-declined by a rules-based underwriter. The undersight platform saw what the rules engine couldn't.

THE PROBLEM

Good deals are getting killed by rigid rules

In alternative finance, speed and accuracy determine who wins. Yet most underwriting still relies on deterministic rule sets and manual review processes that were designed for a different era.

When a small business owner applied for funding through Chat Advance's marketplace, the application was auto-declined within seconds. A rules-based underwriting engine evaluated the deal against a fixed set of criteria and determined it didn't qualify.

But the numbers told a different story. Revenue was consistent. Bank data showed healthy cash flow patterns. The business had been operating for years. The decline wasn't a reflection of actual risk — it was a reflection of the limitations of a system that can only say yes or no, with no room for nuance.

> *"The rules engine couldn't see what was actually there. It checked boxes, not patterns. When the deal didn't fit the template, it was rejected automatically — regardless of the underlying fundamentals."*
>
> — **Sajit Roshan, from *Deterministic Scorecards to Agentic Credit Assessments***

Deterministic Scorecard

- × Fixed threshold rules
- × Binary pass/fail output
- × No contextual analysis
- × Misses edge cases
- × Manual review backlog

VS

Agentic Underwriting

- ✓ Pattern-based risk assessment
- ✓ Nuanced scoring with signals
- ✓ Document intelligence
- ✓ Real-time data enrichment
- ✓ Zero manual intervention

THE SOLUTION

Agentic underwriting with undersight

Chat Advance integrated the undersight platform into their intake workflow. Instead of relying solely on rules-based filters, every application now passes through an AI-powered pipeline that combines document intelligence, enrichment, and risk assessment. Here's what happened when the previously declined applicant re-engaged.

THE PROCESS

From application to funded deal in 4 steps

1. **Applicant engages via chat with Macy, the AI intake agent**
   The applicant started a conversation through Chat Advance's web channel. Macy, the AI intake agent, guided the conversation naturally — collecting application details, requesting bank statements, and clarifying information gaps in real time. No forms, no uploads, no waiting.

2. **Bank data ingested via Plaid and enriched automatically**
   Bank statements were connected via Plaid and processed instantly. The undersight platform parsed transaction-level data into structured intelligence: revenue patterns, existing debt positions, seasonal trends, and anomaly signals. What would take an analyst 20+ minutes was completed in seconds.

3. **RFIs addressed directly with the applicant by the agent**
   When additional information was needed, Macy asked the applicant directly. Missing data points, clarifications on specific transactions, and supplementary documentation were all resolved within the same conversation — no email chains, no delays.

4. **Matching funders receive a rich submission package**
   The completed application was assembled into a comprehensive submission package: structured financial data, enriched risk signals, and supporting documentation. The package was matched to two funders whose criteria aligned with the deal profile. Both received the submission simultaneously.

THE RESULTS

A deal that was dead became funded

Within five minutes of the applicant re-engaging, two funders had received full submission packages and extended offers. A deal that had been automatically rejected by a rules-based system was funded — with better data, faster processing, and zero manual underwriting effort.

The cost of false negatives

Every auto-declined deal that should have been funded represents lost revenue for the marketplace, a missed opportunity for the funder, and a frustrated business owner who needed capital. In a competitive market, these false negatives compound quickly.

Chat Advance's integration with undersight didn't just recover one deal. It established a permanent layer of intelligence that catches what deterministic systems miss — converting false negatives into funded deals, automatically, around the clock.
